Overview	2
1 Data Exploration Analysis	3
1.1 Variable identification	3
1.2 Data Summary Analysis	5
1.3 Outliers and Missing Values Identification	6
2. Data Preparation	7
2.1 Outliers treatment	7
2.3 Tranformation for Variables	9
2.6	9
<del> </del>	10
3.1 Model One	12
3.2 Model two	15
3.3 Model three with leap package	17

#### Overview

To attain our objective, we will be following the below best practice steps and guidelines:

- 1 -Data Exploration
- 2 -Data Preparation
- 3 -Build Models
- 4 -Select Models

```
'data.frame':
                    466 obs. of 14 variables:

### 1 Data Exploration Analysis

In section we will explore and gain some insights into the dataset by pursuing the below high level steps and inquiries:

- -Variable identification
- -Variable Relationships
- -Data summary analysis
- -Outliers and Missing Values Identification

#### 1.1 Variable identification

First let's display and examine the data dictionary or the data columns as shown in table 1 and proportion of success and failure cases in target variable.

```

##	0		0	0	(	)	0	0	0	0	0
##	ptratio	bla	ack	lstat	medv	/ targe	et				
##	0		0	0	(		0				

Table 1: Correlation between target and predictor variable

	Correlation
zn	-0.4316818
indus	0.6048507
chas	0.0800419
nox	0.7261062
rm	-0.1525533
age	0.6301062
dis	-0.6186731
rad	0.6281049
tax	0.6111133

	Correlation
ptratio	0.2508489
black	-0.3529568
lstat	0.4691270
medv	-0.2705507
target	1.0000000

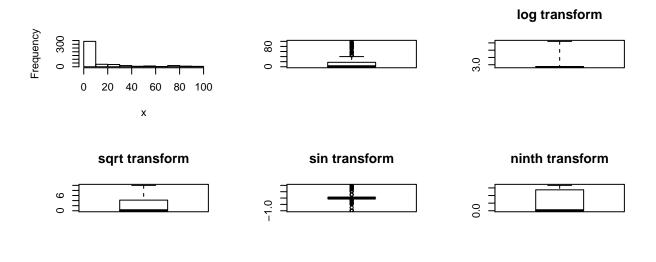

It is clear from the table that most of the variables are having storng correlation with the target variable.

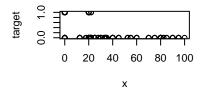

### 1.3 Outliers and Missing Values Identification

In this section we look at boxplots to determine the outliers in variables and decide on whether to act on the outliers.

Lets do some univariate analysis. We will look at the Histogram and Boxplot for each variable to detect outliers if any and treat it accordingly.

Analysis of variable zn:proportion of residential land zoned for large lots

For zn, we can see that there are large number of values with 0. ninth transformation seem better for this variable..(1)

\*

\*\*Please note that we have created similar figures to figure 1 above for each remaining variable. However, we hid the remaining figures for ease of streamlining the report as they have similar shapes. However, we have drawn the below observations from each remaining figure.

For indus, we can see that there is a spike toward right side of he distribution. Looking at the sqrt transformation it appears that distribution is close to normal and having two peaks after transformation.

For nox, there is a long right tail.

For rm, there are some outliers as we can see from box plot. This variable will need some transformation to handle the outliers.

age of the building variable is skewed heavily towards right side. We will need some transformation for this variable and looks sin transformation is best option for this case

For this variable dis, there are some outliers which needs transformation to handle those outliers. log transformation looks best suited for this scenario.

For rad variable distribution is not uniform as seen from the chart and will need transformation.

For tax variable is not uniformly distributed but there is no outlier for this variable.

For pratio has right aligned peak but no outliers are there in data set.

The variable lstat has long right tail and lef skewed

## 2. Data Preparation

Now that we have completed the preliminary analysis, we will be cleaning and consolidating data into one dataset for use in analysis and modeling. We will be puring the below steps as guidlines:

- Outliers treatment
- Missing values treatment
- Data transformation

#### 2.1 Outliers treatment

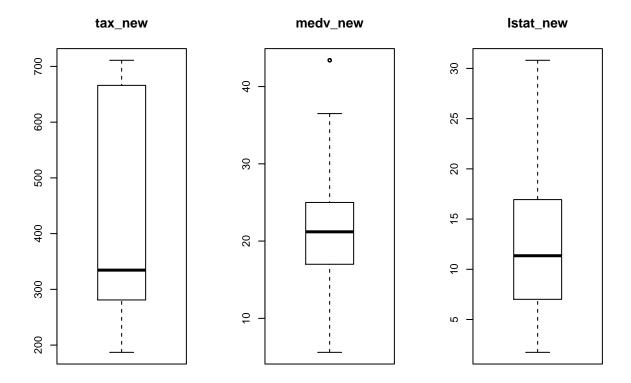

For outliers, we will create 2 sets of variables.

The first set uses the capping method. In this method, we will replace all outliers that lie outside the 1.5 times of IQR limits. We will cap it by replacing those observations less than the lower limit with the value of 5th %ile and those that lie above the upper limit with the value of 95th %ile.

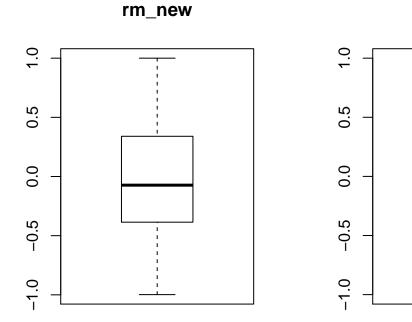

Accordingly we create the following new variables while retaining the original variables.

```
\begin{array}{c} \text{city\_crime\_train} tax \ city_crime_train \text{medv} \\ \text{city\_crime\_train} \$ \text{lstat} \end{array}
```

Lets see how the new variables look in boxplots.

In the second set, we will use the sin transformation and create the following variables:  $city\_crime\_trainrm_new\ city\_crime_traindis\_new$ 

#### 2.3 Tranformation for Variables

Following variables will need some transformation:

- 1. zn: proportion of residential land zoned for large lots (over 25000 square feet) (predictor variable)
- 2. chas: a dummy var. for whether the suburb borders the Charles River (1) or not (0) (predictor variable)

dis\_new

3. target: whether the crime rate is above the median crime rate (1) or not (0) (response variable)

#### 2.6

Lets see how the new variables stack up against wins.

All new variables seem to have a positive correlation with wins. However, some of them do not seem to have a strong correlation. Lets see how they perform while modeling.

# 3 Build Models

Below is a summary table showing models and their respective variables.

#### 3.1 Model One

In this model, we will be using the original variables. We will create model and we will highlight the variables that being recommended using the AIC value.

First we will produce the summary model as per below:

```
##
## Call:
  glm(formula = target ~ . - zn_new - rm_new - lstat_new - tax_new -
##
       medv_new, family = "binomial", data = city_crime_train)
##
## Deviance Residuals:

#### 3.2 Model two

In this model, we will be using the some transformed variables.

First we will produce the summary model as per below:

```
##
## Call:
## glm(formula = target ~ . - zn - rm - dis - tax - lstat - medv,
       family = "binomial", data = city_crime_train)
##
##
## Deviance Residuals:
##
      Min
                10
                      Median
                                   3Q
                                           Max
## -1.7978 -0.1372 -0.0012
                               0.0006
                                        3.7479
